This is a very simple design Vytis, the Lithuanian heraldic shield.

An example of the finished project is on reddit here :

https://www.reddit.com/r/lithuania/comments/1j8yxty/happy_35th_to_all_my_lithuanian_friends_pic_of_a/

It was made on an Xtool M1 Ultra.

The main design file has three canvases with all the needed parts.

Main piece is the upper layer, the knight and outer ring.

Text and flag frame holds the wood cut letters and the flag

Back piece is the rear board, which I painted before cutting.

The rear board is also scored before cutting so that the pieces can be individually glued into place in the design and then painted as needed.

There is also an SVG file (vytis centerpiece) of the figure for those who do not use Xtool and wish to use the figure itself.
